

Thank you for purchasing [WEISSLICHT](#) LED License Plate Lights

THE FOLLOWING IS A SPECIAL INSTALLATION NOTE FOR SOME TYPES OF LED LICENSE PLATE LIGHTS.

If your vehicle has bulb prongs like those shown in the picture below this installation note is for you. Some vehicles come from factory with a standard filament tube bulb being held between these two prongs. Sometimes the angle of these prongs is not ideal and they need to be bent slightly to make a proper connection to the LED License Plate Light lens.

If you install your new LED lenses and a strong connection is made then you do not need to make any alterations to the clips. If you find that the LED lights are blinking on an off showing a poor connection, or if there is no connection at all please follow the instructions below to help remedy this issue.

- 1) Bend in the clips till they are at about the position shown in the photo above with the white arrows.
- 2) If the connection is still weak when the LED lens is installed, then try bending both clips towards you slightly as shown with the grey arrow.

A variation of these techniques will help align the prongs with the connection points on the LED Lens.

(Please make sure that the car lights are on when performing this test. Insert your original bulbs occasionally to be sure).
